2048

2048 is a simple, single-player web game developed by Gabriele Cirulli in 2014. The goal of the game is to merge numbered squares together with increasing powers of two until you reach 2048 (2^{11}).

8	4		
32	8	4	2
64	16	8	4

Problem

- What would a game of 2048 look like with multiple players?
- Which algorithms would perform the best when playing this hypothetical game?

How the game works

Initial State

Score: 0			
0	0	0	0
0	0	2	0
2	0	0	0
0	0	0	0

2	0	0	0
0	0	0	0

Tilt ↑

Score: 4			
4	0	0	0
0	0	0	0
0	0	0	0
0	0	0	0

Tile Generation

Score: 4			
4	0	0	0
0	0	0	0
0	0	2	0
0	0	0	0

Methods

Minimax

Expectimax

Monte Carlo Simulations

Hypotheses

- When our algorithms play against a random adversary, the score distribution should be right skewed and bimodal.
- Monte-carlo should perform the best in all cases.
- Minimax will perform very poorly, even when compared to a random player.

Conclusions

Average scores between algorithms with 99% Confidence Interval

Average scores for Algorithms Against Random Adversary with 99% Confidence Interval

Limitations

- Computationally limited for depth of Expectimax and Minimax, and for rollouts and rollout depth for Monte-Carlo simulations
- Not feasible to run laptops for longer than overnight
- The speed of python for running simulations is somewhat limiting

Demo time!
